

# The View from the Center of the Universe: A Journey to the Heart of Human Curiosity

In the beginning, there was nothing. Or rather, there was everything, but it was all compressed into a tiny point of infinite density and heat. Then, about 13.8 billion years ago, the universe exploded into existence in an event we call the Big Bang. From that moment on, the universe has been expanding and cooling, and it has given rise to everything we know, including our planet Earth and the human race.

How do we know this? How do we know anything about the universe at all? That's where science comes in. Science is a process of observation, experimentation, and logical reasoning that allows us to understand the world around us. And thanks to science, we have learned a great deal about the universe, including its age, size, composition, and history.
